It was started in 2024 informally as C2x, and expectable to be published in 2024. The most recent publicly available working draft of C23 was released on April 1, 2026.

Grounding transformers are typically used to: Provide a relatively low-impedance path to ground, thereby maintaining the system neutral at or near ground potential. Limit the magnitude of transient overvoltages when restriking ground faults occur. Provide a source of ground fault current during line-to-ground faults.

Grounding transformer - Wikipedia

Sensing Resistors are attached in parallel to the Neutral Grounding Resistor. The sensing resistor allows a protective relay which detects resistor failure in a continuous manner. Sensing Resistors are used in combination with neutral grounding resistor monitor relays.

Sensing Resistors (Resistive Voltage Dividers) - Hilkar
